

## Using the Standard Normal Distribution Table

Assume that the variable  $Z$  is normally distributed with mean zero and variance 1, i.e.  $Z \sim N(0, 1)$ . Compute:

1.  $\Pr(Z \leq -1.32)$  (Probability that a realization of the random variable  $Z$  is smaller or equal than  $-1.32$ )
2.  $\Pr(Z \geq 1.32)$
3.  $\Pr(-1.32 \leq Z \leq 1.84)$

### Solution

1. Consider the first column of Table G.1 in Fig 1, headed by  $z$ .  $z$  goes from  $-3.0$  to  $3.0$ , with steps equal to  $0.1$ . The top row (right hand of  $z$ ) refers to the second decimal of  $z$ . The table reports cumulative probability (in yellow), i.e.  $\Pr(Z \leq z)$  for a given value  $z$ . Consider the two horizontal red lines in Fig 1; the interpretation is the following

$$0.0968 = \Pr(Z \leq -1.3), \quad 0.0951 = \Pr(Z \leq -1.31), \quad 0.0934 = \Pr(Z \leq -1.32)$$

The answer to the first question is therefore  $\Pr(Z \leq -1.32) = 0.0934$ .

2.  $\Pr(Z \geq 1.32) = 1 - \Pr(Z \leq 1.32)$ .  $\Pr(Z \leq 1.32) = 0.9066$  (see Fig 2), so

$$1 - \Pr(Z \leq 1.32) = 0.0934.$$

*Alternative Solution:* By the symmetry of the distribution

$$\Pr(Z \geq 1.32) = \Pr(Z \leq -1.32)$$

3.  $\Pr(Z \leq 1.84) = 0.9671$ , so

$$\Pr(-1.32 \leq Z \leq 1.84) = \Pr(Z \leq 1.84) - \Pr(Z \leq -1.32) = 0.9671 - 0.0934.$$

$$P(Z \leq z) = \text{prob}$$
